

Code challenge - Back end

To evaluate your skills, we'd like you to build an application, to read the data from a CSV file and to store that data into a MySQL database.

Input:

The CSV file that has been shared with you via email.

Output:

A database table with the same data as in the CSV.

Guidelines:

- Use the language/framework/library of your choice
- All the rows from the CSV must be saved into the DB
- The database must be MySQL
- Make it concise, readable and correct

Please describe in README.md

- How to run it (don't assume everything is already installed)
- What you would have done better if you had more time

Should you have any questions about this challenge, feel free to reach out to us.

Please include a dump of the MySQL DB in the repository, and, when you are done, send us a link to the public repository on GitHub.
